

Matlab tips and tricks

This page documents how to do some non-obvious things with Matlab¹.
The instructions below have been tested with Matlab 7.5 .

1 Setting axis graduation and name

When drawing a graph, to set your axis graduation, draw your graph and run:

```
set (gca, 'XTick', [-2:2])
```

replacing [-2:2] by the values you want on your X-axis.

To set your axis name, run:

```
xlabel ('x')
```

replacing 'x' with your X-axis name.
